FOOD DELIVERY APP

UI/UX DESIGN INTERNSHIP SUBMISSION

Project Overview

A simple food delivery app concept focused on making food ordering clear, quick and easy for college students. This document records the early-stage UX planning and low-fidelity interface structure.

Basic User Research

Problem: Users may find existing food delivery apps cluttered, making it harder to locate food and complete an order.

Need: A simple ordering experience with clear prices, easy navigation and useful order tracking.

Quick research: In a small informal discussion with three friends, participants expressed interest in one-tap reordering and order tracking. This is an initial insight, not a representative survey.

Research focus	Initial finding
Ease of use	Keep the ordering steps simple and visible.
Price clarity	Show item price and order total clearly.
Order updates	Provide an easy way to track an order.

Research note: Validate these early findings with more users before finalizing the design.

User Persona

A sample persona created to represent a potential target user. Replace or refine this profile using your own research responses.

RAHUL 21 years old College Student **Typical context** Orders meals between classes and prefers a quick mobile experience.	**Goals** • Order affordable food quickly • Browse nearby options • Know when the order will arrive **Frustrations** • Too many pop-ups and ads • Unclear extra charges • Difficult navigation

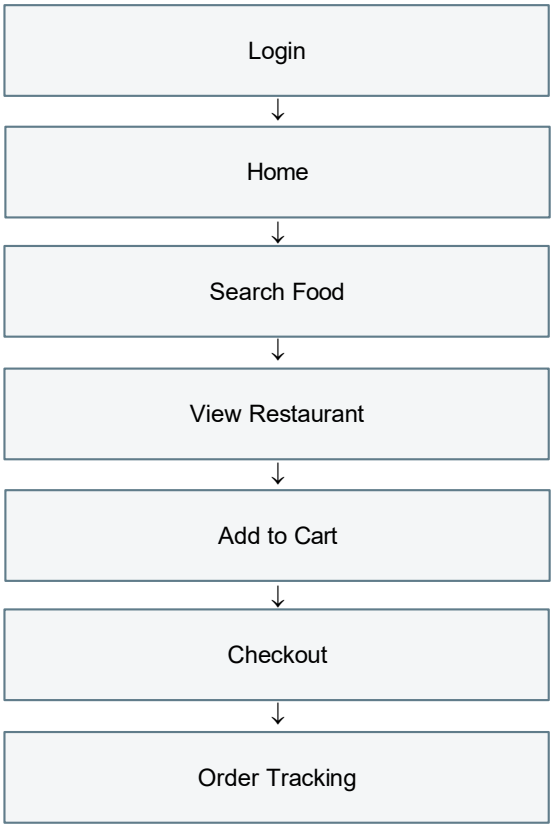

Design implication

Prioritize a clear search area, readable food and price information, a visible cart summary and straightforward order tracking. Avoid unnecessary interruptions during ordering.

Persona type: illustrative sample. It should be updated when research provides more detailed evidence.

User Flow

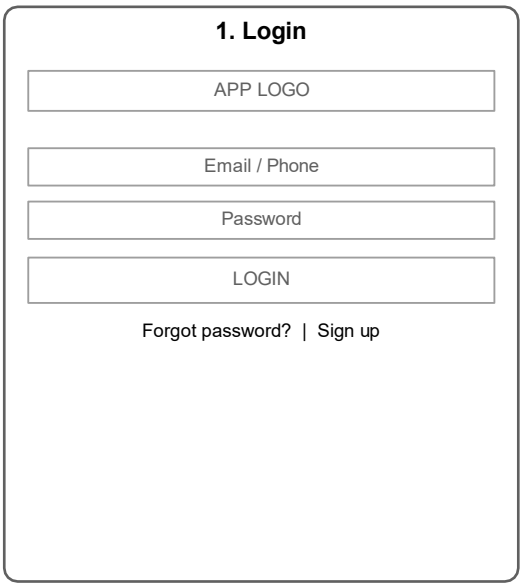

The flow below shows one possible path from opening the app to tracking a placed order.

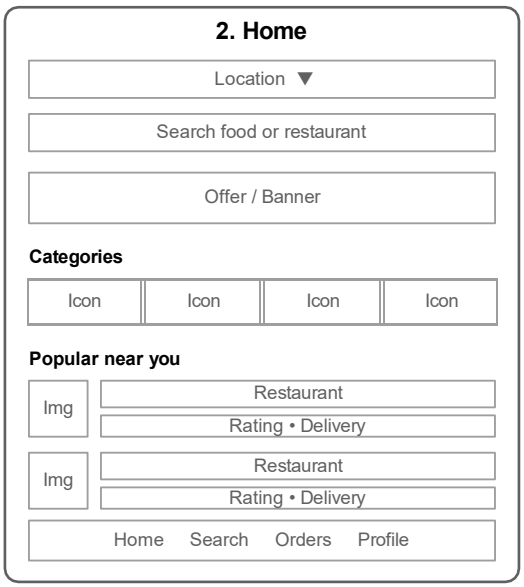

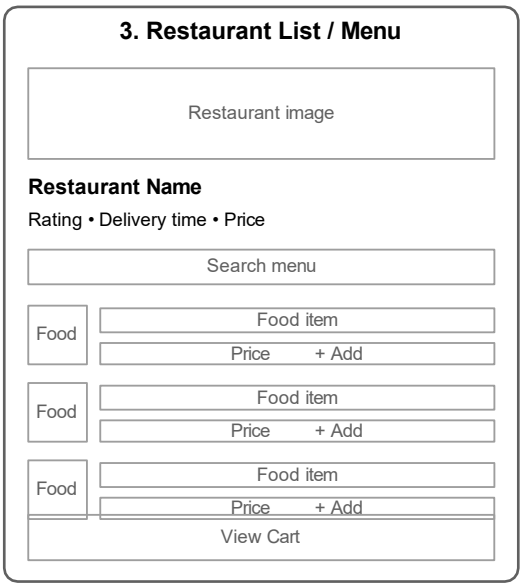

Flow note: If the user is already signed in, the flow can begin at Home. Payment and order confirmation are represented within Checkout before Order Tracking.

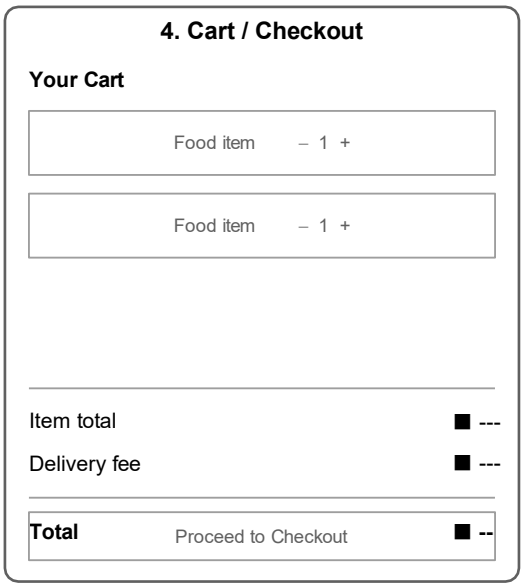

Low-Fidelity Wireframes

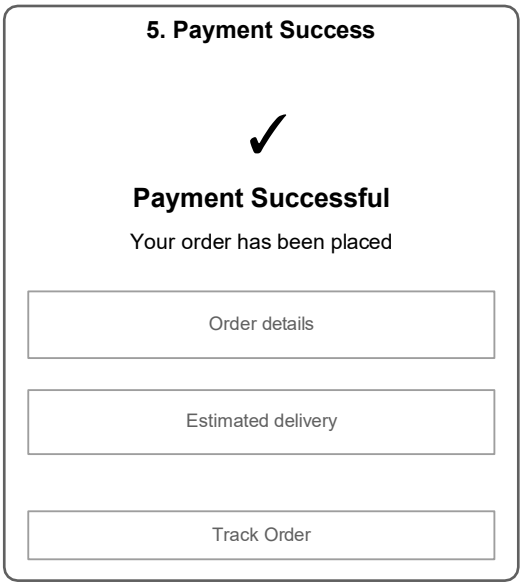

These grayscale wireframe sketches show the basic layout and key controls for five app screens. Recreate or refine them in Figma and replace these sketches with your own Figma screenshots for final submission.

Design Thinking

Empathize: Understand user needs through basic conversations and research.

Define: The key problem is a confusing and cluttered ordering experience.

Ideate: Plan a simple flow with clear prices, search and tracking.

Prototype: Create five low-fidelity screen layouts and refine them using feedback.
